# Buff Bites

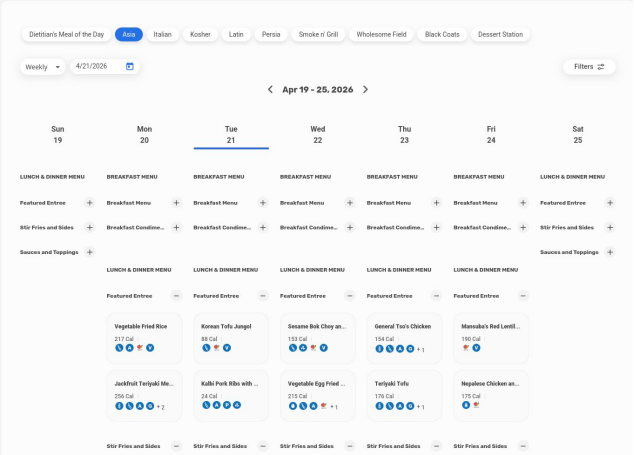
By: Alex Fabian, Aditya Gupta, Erin Fels, Kevin Vu, and Inas Siddique

# 01 Description

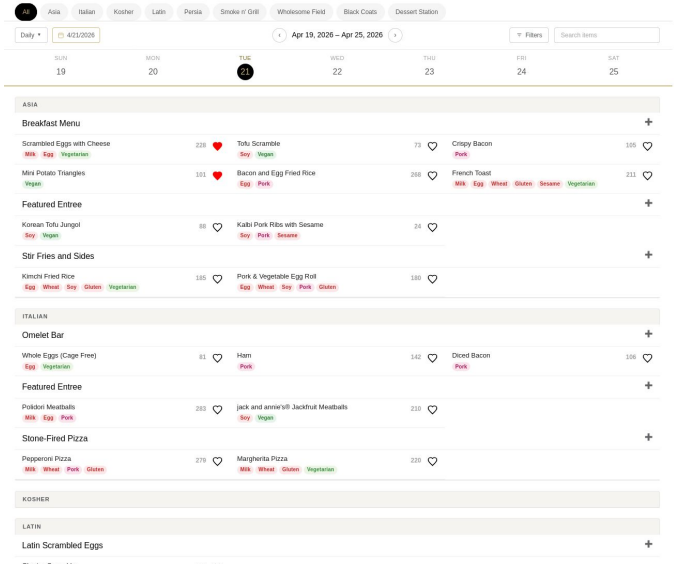
Buff Bites is a replacement for CU's current online menu app Nutrislice. It has the menu for every dining location on campus. Buff Bites also has a convenient menu layout, allows users to search for and filter items, and has a profile feature that lets users favorite items. Buff Bites pulls its menu data straight from Nutrislice which makes it a feature complete replacement.

# Comparison to Nutrislice

Nutrislice
- Can only view 1 station at a time
- No search



Buff Bites
- All Menus
- Favorites



# 02 Tools Used

GitHub (4): project tracker, VCS
Postgres (5): database, iterative
Application Server (5): NodeJS
HTML (4): UI
Express (5): Framework
PG-Promise (5): JS Postgres api

Render (4): deployment environment
Mocha (4): testing
Chai (4): testing
HandleBars (3): UI
Bcryptjs (4): Authentication
Express-Session(4): Authentication

## External Nutrislice API (2)

Access to live Nutrislice data

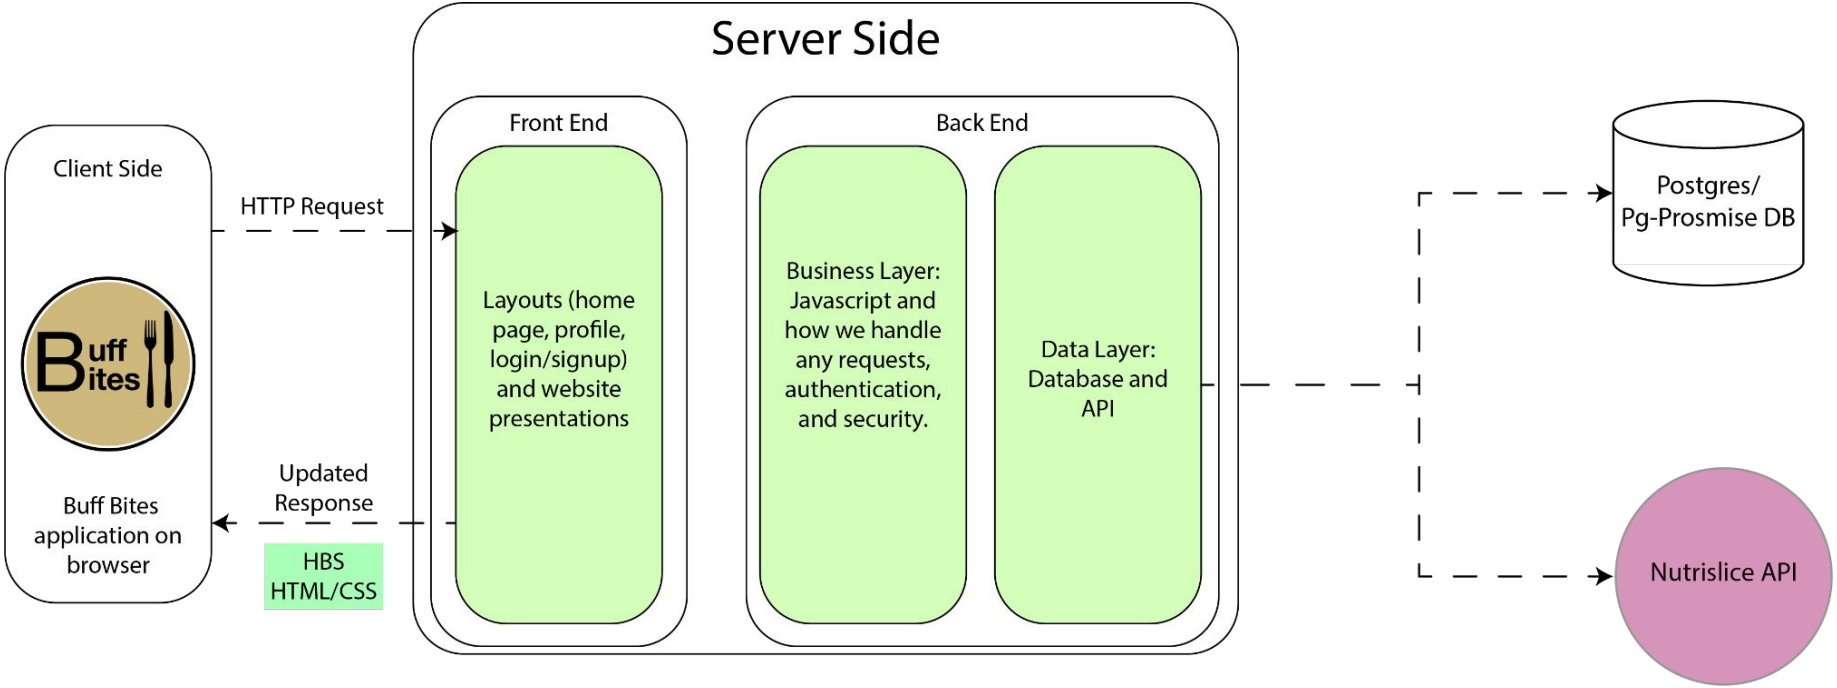
## Methodologies

Agile, Iterative
Weekly meetings on Zoom

# 02 Tools Used

(Option 2) Tools

# 03 Architecture Diagram



# 04 Challenges

- **Home Page Creation**
  - Creating the homepage it was hard to figure out the structure but we wanted a more accessible/intuitive homepage for users. So using referencing the nutrislice home page we took the structure and improved it for user accessibility.

- **Dining Hall Menu API Integration**
  - Getting the menu data directly from Nutrislice was difficult partly because Nutrislice's own API made it difficult to get the menu data. We call multiple public nutrislice endpoints within our own API and combine their results.

- **Git Collaboration and Merge Issues**
  - We faced a few merge conflicts and rejected pushes between some of our branches/features. We fixed this by using git pull - -rebase, resolving conflicts as necessary and merging properly. This slowed development but prevented lost work.

- **Layout and Cohesive Visual Design**
  - Making sure that although there were three different people working on the layout and visuals of the website it looked like one person made all pages. We wanted it to make sense to those using it and not be choppy and different so we made a centralized color palette and logo and came together after pages were done and rechecked other pages layouts

# 05 Demo

# 06 FUTURE SCOPE/ENHANCEMENT

If you were to continue working on this project, what are the key features you would consider integrating to increase its value or applicability in the real world? List at least 3 enhancements.

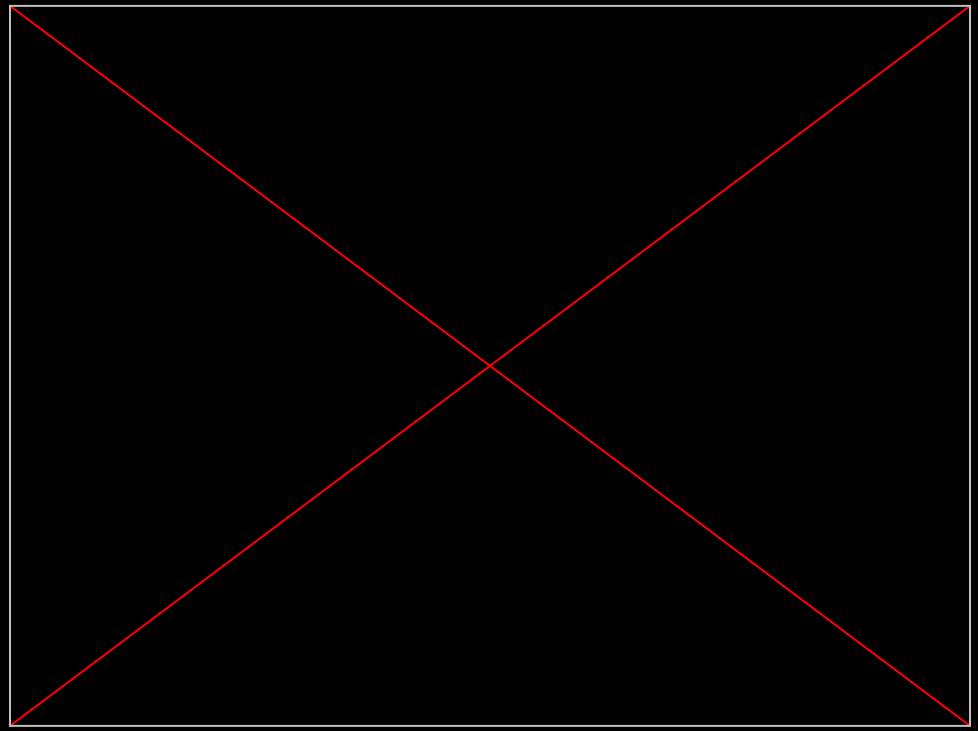
- Community ratings for food items. This would let students view popular items and rate their favorites.

- More profile options. Dietary preferences, like vegetarian or vegan, and disliked ingredients to avoid could be saved and reflected in the menu view.

- Better item filtering for items that aren't traditional "sides" or "entrees" that are included in the nutrislice API. Could involve a completely independent backend.

- Dietary Advisor. An integrated AI tool that would help students build the best meal with the available food items, keeping in mind their preferences & food restrictions.

# Questions?

# THANK YOU


# Video Demo (we'll probably show more in depth)
